Sequencing is completed to a minimum standard of double strand coverage with a minimum of 2 clones and 2 reads with no ambiguities or 2 chemistries with a minimum of 2 clones and 3 reads with no ambiguities. If the sequence quality does not meet this standard, it will be indicated in the annotation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Exon/Intron boundaries of identified genes were chosen if there were canonical splice junctions that maintained sequence continuity across the splice junctions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Direct Submission

On Mar 22, 1999 this sequence version replaced gi:4376009.

IMPORTANT: This sequence is unfinished and does not necessarily
represent the correct sequence. Work on the sequence is in progress and the release of this data is based on the understanding that the sequence may change as work continues. The sequence may be contaminated with foreign sequence from E.coli, yeast, vector, phage etc. Order of segments is not known: 800 n's separate segments. Unfinished: dJ856G1 Contig_ID: 01260 acc-AL03381

Length: 151795 bp.

* NOTE: This is a 'working draft' sequence.

* This record will be updated with the finished sequence

* as soon as it is available and the accession number will

* be preserved.

X20559 Polynucleotide seq X30293 Borrelia burgdorfe	ALIGNMENTS	-945). CR; primer; amplifica thy; interleukin-1-al ; SS.	reducting increased risk of signt-treatening diabetic retinopathy comprises identifying genetic polymorphism pattern for genes II-1A, IL-1B and IL-1RN, useful to allow treatment before clinical symptoms occur.  Claim 2; Page 33, 41pp; English.  Interleukin-1-alpha (IL-1-alpha) primers 1 and 2 (V32390) were used to amplify the IL-1-alpha gene region to identify single base variation polymorphism of C/T at base 889. The invention claims to provide a method for predicting the risk of sight threatening diabetic retinopathy. The method involves isolating DNA from a patient and determining the polymorphism pattern of the genes that code for interleukin-1-alpha, interleukin-1-beta and interleukin-1RN. The polymorphic pattern interleukin-1-beta and interleukin-1RN. The polymorphic pattern determination of the genes that carrying a genetic polymorphism patterns thereby identifying patients carrying a genetic polymorphism associated with increased risk of sight threatening diabetic retinopathy. The method may be able to identify diabetic patients at risk before the clinically detectable disorders occur. Polymorphism pattern determination of IL genes involved PCR reactions using primers V32389. The method is also claimed to be useful in conjunction with identification of other genes associated with sight threatening diabetic retinopathy in genomic DNA and therefore, in identifying diabetic patients expressing multiple risk patterns. It may also induce or suppress interleukins, cytokines and growth factors. Modulators of this protein are used to treat or prevent conditions associated with abnormal levels of inflammation, or activity of IL-1 or its receptor complex.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New isolated nucleic acid encoding the new human cytokine Tango-77 - New isolated nucleic acid encoding the new human cytokine Tango-77 - New isolated nucleic acid encoding the new human cytokine Tango-77 - Stample 5; Figure 3; 226pp; English.

X02956.X03048 and X22301-X22304 are overlapping BAC genomic sequences containing alternatively spliced forms of human IL-1ra. Such fragments are used in the method of the invention which describes the isolation of a novel human TANGO-77 encoding nucleic acid and protein. Tango-77 is a member of the cytokine superfamily that is expected to inhibit inflammation by binding to the interleukin-1 receptor (IL-1R). It may also bind to a new receptor so could require other cellular processes associated with acute or chronic inflammation, e.g. asthma, chronic hard also be a second of a second of arthritis, possissis and inflammatory and also second remarkable.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human LL-1ra National DNA sequence 33.

Human: LL-1ra: cytokine superfamily; inflammation; inhibition; interleavin-1 receptor; LL-1R; regulation; asthma; rheumatoid arthritis; interleavin-1 receptor; LL-1R; regulation; asthma; rheumatoid arthritis; chronic myelogenous leukaemia; psoriasis; inflammatory bowel disease; growth factors; treatment; IL-1 receptor complex; BAC; ss.
                                                                                                Tile of the patient's genetic polymorphism pattern - allows are described of increased periodontal disease severity prediction of increased periodontal disease severity are districted of increased periodontal disease severity prediction of increased periodontal disease severity as Page 25; 33pp. English.

Solve of the primers (170316 and 11388-88) can be used in a new method for identifying a genetic predisposition to periodontal disease by continent from a genetic predisposition to periodontal disease by completed with severe disease were identified as IL-1B.

Alleles associated with severe disease were identified as IL-1B.

Alleles associated with severe disease were identified as IL-1B.

Completed to restriction disease of the primers are used subjected to restriction disease of determine the polymorphism at IL-1A base -889 can be identified wing primers (770316 and TIS84) corresponding to bases -967 to -945 and -888 to -869, crespectively. An NCOL site is create; if C is available at -889,

New method of determining a patient's susceptibility to inflammatory disorder. Dy deterting the presence of an IL-1 (44112332)

The activity of proteins produced by the IL-1 gene cluster

The activity of proteins produced by the IL-1 gene cluster

The activity of proteins produced by the IL-1 gene cluster

The activity of groteer. The method comprises the detection of an interleukin I (IL-1) (44112332) haplotype in a sample obtained from the patient, where its presence indicates susceptibility to an inflammatory disorder. Mi6607 to X16631 represent PCR primer used in the method for detecting the IL-1 (44112332) haplotype. The method provides kits for the early prediction of a patient's susceptibility to inflammatory disorders, including coronary artery disease, osteoporosis, nephropathy in diabetes mellitus, alopecia areata, Graves disease, systemic lupus erythamatosus, lichen sclerosis and ulcerative colitis. The detection of alsorders, comprising diabetic retinopathy, juvenile chronic arthritis, psoriasis, and insulin dependent diabetes. The identification of a disease. Sociated haplotype enables determination of which alleles are causative, and this information is useful in designing treatment using various agents that modulate the activity of proteins produced by the IL-1 gene cluster are associated with particular contains and insulin determining genetic susceptibility to according the pathology of these diseases. Therefore, the use of IL-1 gene cultification in determining gene therapy with a mollogy of these diseases. Therefore the use of IL-1 gene cultification in the pathology of these diseases. Therefore the use of IL-1 gene cultification in manning genetic susceptibility to an intendent.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

                                                                                                                                                                                                                                                                                      anti-S. aureus vaccines
Claim 1; Page 2938; 3271pp; English.
This sequence represents one of 5191 Staphylococcus aureus DNA sequences
of the invention. The DNA sequences are recorded on a computer readable
medium, preferably selected from a floppy or hard disk, random access
of the invention. The DNA sequences are recorded on a computer readable
medium, preferably selected from a floppy or hard disk, random access
of the invention. The DNA sequences are recorded on a computer readable
menory (RAM), read-only memory (ROM) or CD-ROM, Homology searches using
the S.aureus DNA sequences allows putative functions to be assigned so
that protein-encoding or regulatory regions of commercial, therapeutic or
that protein-encoding or regulatory regions of commercial, therapeutic or
industrial importance can be obtained. Specifically, sequences which are
likely to encode antigens have been identified and these polypeptides can
be used in a vaccine composition against S.aureus infection. The
solvepeptides can also be used in a kit for the immunodetection of
S.aureus in a sample. S.aureus is implicated in numerous human diseases,
including cellulitis, eyelid infections, food poisoning, osteomyelitis,
skin and surgical wound infections, scalded skin syndrome, toxic shock
syndrome, etc. Organisms transformed with the DNA sequences can be used
for recombinant production of the polypeptides. The new DNA sequences
can be traced any of the Saureus DNA sequences contained on the
computer readable medium.
Sequence 327 BP; 87 A; 75 G; 77 T;
           16-MAR-1999 (first entry)
Staphylococcus aureus contig SEQ ID #4372.
Computer readable medium: vaccine; S.aureus infection; immunodetection; cellulitis; eyelld infection; food poisoning; osteomyelitis; therapy; skin infection; surgical wound infection; scalded skin syndrome; toxic shock syndrome; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Staphylococcus aureus config SEQ ID #1336.

This sequence represents one of 5191 Staphylococcus aureus DNA sequences of the invention. The DNA sequences are recorded on a computer readable medium, preferably selected from a floppy or hard disk, random access memory (RAM), read-only memory (RAM) or CD-ROM. Homology searches using the S.aureus DNA sequences allows putative functions to be assigned so that protein-encoding or regulatory regions of commercial, therapeutic or industrial importance can be obtained. Specifically, sequences which are likely to encode antigens have been identified and these polypeptides can be used in a vaccine composition against S.aureus infection of S.aureus in a sample. S.aureus is implicated in numerous human diseases, collypeptides can also be used in a kit for the immunodetection of S.aureus in a sample. S.aureus is implicated in numerous human diseases, skin and surgical wound infections, food poisoning, osteomyelitis, skin and surgical wound infections, scalded skin syndrome, toxic shock syndrome, etc. Organisms transformed with the DNA sequences can be used for recombinant production of the polypeptides. The new DNA sequences (and their fragments) are useful as primers or probes for isolating computer readable medium.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

The present sequence encodes nitrile hydratase subunit beta, a novel protein isolated from Bacillus smithii. The protein has hydration activity for converting acrylonitrile into acryloamide. It is useful for producing amide from nitrile by biological catalysis.

Claim 1; Page 2639-2640; 3271pp; English.

Cofficient of the invention. The DNA sequences are recorded on a computer readable medium, preferably selected from a floppy or hard disk, random access memory (RAM), read-only memory (ROM) or CD-ROM. Homology searches using the S.aureus DNA sequences allows putative functions to be assigned so that protein-encoding or regulatory regions of commercial, therapeutic or industrial importance can be obtained. Specifically, sequences which are likely to encode antigens have been identified and these polypeptides can likely to encode antigens have been identified and these polypeptides can
                                                                                                                                                                                        the sequence listing in the specification. They are included to maintain the nucleotide numbering given in the specification for this DNA sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    be used in a vaccine composition against S.aureus infection. The polypeptides can also be used in a kit for the immunodetection of S.aureus in a simplicated in numerous human diseases, including cellulitis, eyelid infections, food poisoning, osteomyelitis, skin and surgical wound infections, scaleded skin syndrome, toxic shock syndrome, etc. Organisms transformed with the DNA sequences can be used for recombinant production of the polypeptides. The new DNA sequences
                                   Staphylococcus aureus config SEQ ID #3678.

(1aim 1, Page 593-597; 1150pp; English.
X20500-21243 represent polynucleotide sequences from the genome of Treponema pallidum. The sequences can be used for detection, diagnosis, characterisation, prevention and therapy for T. pallidum infections, particularly syphilis. They can also be used for detection diseases related to Borrella infections in animals, and for the production of biosynthetic products such as enzymes.
Sequence 6422 BP; 1848 C; 1547 G; 1361 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          05-MAY-1999 (first entry)
Polynucleotide sequence from the genome of Treponema pallidum.
Treponema pallidum infection; syphilis; Borrelia infection; animal;
Treponema pallidum.
Treponema pallidum.
W09859034-A2.
                                                                                                                                                        Example; Page 48; 53pp; English.

By interferon gene and method for the prodn. of interferon in yeast by use of recombinant DNA segment contg. suc 2 promoter linked to interferon gene. The interferon synthesis can be regulated over a broad range by changes in the culture medium, e.g. synthesis is repressed in glucose medium and de-repressed when glucose is depleted. Also claimed is yeast strain ATCC 20644-GG1144.

Sequence 1253 BP; and a sequence 1253 BP; seat strain ATCC 20644-GG1144.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         19-WAR-1999 (first entry)
Enterococcus faecalis genome contig SEQ ID NO:159.
Enterococcus faecalis; contig; detection; Enterococcus infection; vaccine; attenuation; computer readable medium; ds.
Enterococus faecalis.

A computer readable medium has been developed which has recorded on it 982 nucleotide sequences isolated from the Enterococcus faecalis genome. X12938 to X13919 represent these nucleotide sequences which are primary nucleotide sequences, also known as contigs. The computer based system commercial importance. The products can be used to detect the presence of Enterococcus faecalis in samples. They can also be used for diagnosing Enterococcus infection in an animal and monitoring modulate the growth or pathogenicity of Enterococcus faecalis, or another related organism, in vivo or in vitro. In particular the polypeptides encoded by the Enterococcus faecalis nucleotide sequences

Polynucleotide(s) and proteins derived from Staphylococcus aureus stored on computer readable medium and used in the production of anti-S.aureus vaccines
claim 1; Page 2772-2773; 3271pp; English.
This sequence represents one of 5191 Staphylococcus aureus DNA sequences of the invention. The DNA sequences are recorded on a computer readable medium, preferably selected from a floppy or hard disk, random access memory (RAM), read-only memory (ROM) or CD-ROM. Homology searches using the S.aureus DNA sequences allows putative functions to be assigned so that protein-encoding or regulatory regions of commercial, therapeutic or industrial importance can be obtained. Specifically, sequences which are likely to encode antigens have been identified and these polypeptides can be used in a vaccine composition against S.aureus infection. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                               /*tag= a //note= "these bases represent a line of missing text in /note= "these bases represent in the specification. They are included to maintain the nucleotide numbering given in the specificatio. for this DNA sequence"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        be used in a vaccine composition against S. aureus infection. The polypeptides can also be used in a kit for the immunodetection of S. aureus in a sample. S. aureus is implicated in numerous human diseases, including cellulitis, eyelid infections, food poisoning, osteomyelitis, skin and surgical wound infections, scalded skin syndrome, toxic shock syndrome, etc. Organisms transformed with the DNA sequences can be used for recombinant production of the polypeptides. The new DNA sequences (and their fragments) are useful as primers or probes for isolating homologues of any of the S. aureus DNA sequences contained on the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Staphylococcus aureus contig SEO ID #3947.

This sequence represents one of 5191 Staphylococcus aureus DNA sequences of the invention. The DNA sequences are recorded on a computer readable for the invention. The DNA sequences are recorded on a computer readable medium, preferably selected from a floppy or hard disk, random access nemory (RAM), read-only memory (ROM) or CD-ROM. Homoloav searches using the S.aureus DNA sequences allows putative functions to be assigned so that protein-encoding or regulatory regions of commercial, therapeutic or industrial importance can be obtained. Specifically, sequences which are industrial importance can be obtained. Specifically, sequences which are be used in a vaccine composition against S.aureus in sample. S.aureus is a sample. S.aureus is a sample and against S.aureus in a sample. S.aureus is implicated in numerous human diseases, scholang cellulitis, eyelld infections, food poisoning, osteomyelitis, concluding cellulitis, eyelld infections, scalded skin syndrome, toxic shock syndrome, etc. Organisms transformed with the DNA sequences can be used (and their fragments) are useful as primers or probos for isolating concluding cellul as primers or probos for isolating concluding contained on the concent of the solatones contained on the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

Anote-Torgan: Kidney; Vector: p7713D-pac (Pharmacia) with a modified polylinker; Site_1: Not I; Site_2: Eco RI; Plasmid DNA from the normalized library NCI_CGAP_Kid3 was prepared, and ss circles were made in vitro. Following HAP purification, this DNA was used as tracer in a subtractive hybridization reaction. The driver was PCR-amplified cDNAs from a pool of 5,000 clones made from the same library (cloneIDs 1322376-1333911, 1456007-1456775, and Fatima Bonaldo.

requests: clonerequest@sanger.ac.uk
on Jan 16, 1999 this sequence version replaced gi:3927943.
During sequence assembly data is compared from overlapping clones.
Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.
This sequence is the entire insert of clone 596H12. This sequence has been finished according to sequence map criteria as follows. An attempt is made to resolve all sequencing problems, such as compressions and repeats, but not necessarily within known annotated human repeat sequence elements (e.g. Alu). Where the sequence is ambiguous, there is an annotation using the 'unsure'
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          igger3(Golem) repeat: matches 2. .142 of consensus"
